

### *ЗАМЕТКА*

---

**New Records of Jewel Beetle *Eurythyrea aurata* (Coleoptera, Buprestidae), a Rare Species in Ukraine [Новые находки златки *Eurythyrea aurata* (Coleoptera, Buprestidae), редкого вида в Украине].** — Two females of *Eurythyrea aurata* (Pallas, 1776) were collected on the bank of the Dnieper River in Cherkassy Region. The first one was found near Kruglik Island (environment of Kanev Natural Reserve), 17.06.2010 (J. Demura leg.), and the second in Kanev Natural Reserve, 06.2010 (collector not indicated). This rare species is trophically associated with poplars and willows, namely with large and dying off trees. Such separately growing or tumbled down trees can often be found along big rivers, and all finds of *E. aurata* known to me are from such biotopes (Kyiv, Zaporozhia, Odessa Regions). The beetles are caught ashore and not near trees that shows them actively flying in search of food plants. — **A. V. Prokhorov** (Schmalhausen Institute of zoology, NAS of Ukraine, Kyiv), **J. K. Demura** (Taras Shevchenko National University of Kyiv).
